

Web Based fashion dressing System

Abstract

Fashion Designers sells their fashion product for customers. It also sews and design quality clothes for their customers. Customer's buys and orders fashion clothes. But buying and ordering are made manually. In this context, we propose a system which brings customers and other people close to the fashion product sellers. Our system consists of web application which will serve as a platform for designer's and customers to sell and buy their design products. This system aims at giving a profitable price to fashion product sellers and customers. This allows the customers to buy products from the fashion designers at a lower than the normal price.

This system is used to Dress-service seller and customer. Dress-service sellers uploads their product with details and buyers view these details and book that product with in a time.

Advantage of this system

- System is providing platform such as web-based system where in dress-service can sell his products at different layer of marketing chain (customer, people or end user) with multiple option. This platform will help fashion designers dress-service to find out the desired yield from customers and sell products to customers, its current stock details and its demand for particular product within less time & with less effort.
- Customers can use this facility and can learn how it is possible and how they can use e-Dressing to sell his product. This application will act as unique and secure way to perform fashion-marketing. The system allows customers to buy a qualified dress directly from dress-service.
- This web-based system converts whole offline manual system to online.
